

**INTRO(VIII)**

**INTRO(VIII)**

**INTRODUCTION TO SYSTEM PROGRAMS**

This section discusses commands which are not intended for use by the ordinary user, in some cases because they disclose information in which he is presumably not interested, and in others because they perform privileged functions.

The following commands have been moved from the first edition MERT Programmer's Manual Section D into this Section VIII, replacing UNIX commands with the same name:

*check, dcheck, df, dump, icheck, mkfs, mknod, mkpt, , and restor.*

Not supported under MERT Release 0 are the following UNIX Generic 3 programs:

*accton, errdemon, errpt, iostat, load, mkconf, sa, and telinit.*

The command *fsck* is new.

The whole Section VIII (10) has been reissued.
